delivering hire insights.

# Migrating a 15 year old infrastructure to the cloud

Infrastructure as code

Testing Everything

What's been successful (and probably a little about what hasn't)

# Goals

## REMEMBER...

WHEN THIS WAS YOUR ONLY GOAL?

DIY.DESPAIR.COM

- Modernize & replace aging infrastructure
- Improve application & server deployments
- Improve stability and flexibility of our application
- Remove Knowledge Silos

# What Problems Exist?

# Manual Changes

# Everything is Always Broken

# Everything Takes Too Long

# Silos of Knowledge

# Tools

# How We Create Environments

**Terraform to define infrastructure & manage state**

**Puppet to manage configuration**

**Abstract the differences**

**Write tests to prove it**

# How We Migrate Between Environments

**Environments are defined by git branches**

**With that environment's configuration**

**And tests**

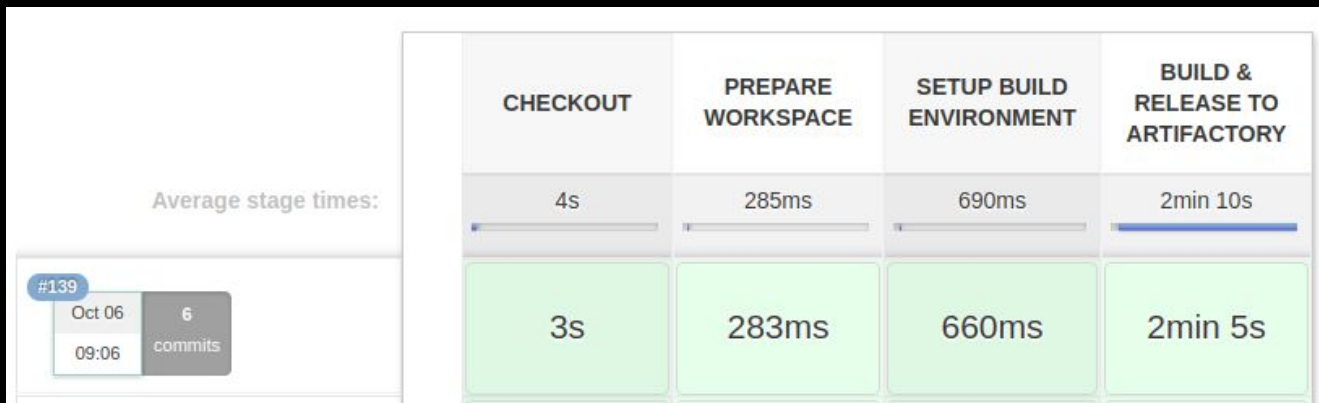

# How We Deploy

**Automation using Jenkins pipelines & DSL Plugin**

**Orchestration using Choria playbooks**

**Custom mcollective agents**

# Continuous Integration & Automation

**All of this is reflected on our build monitor which is visible to anyone in our team space**

# What Lessons Have We Learned?

Get Everyone Involved Early

**Early is on time.**

**On time is late.**

# Choose the Right Team

# Be Flexible

# Discover Problems Quickly

~~FAIL~~  
LEARN  
FAST

@JeremiahGardner

# Automation is Reproducible

# Questions?
